

DHI's BlueCast: DSS for the Maritime Economy

Mittwoch, 18. Juni 2025 16:38 (12 Minuten)

This short presentation addresses one of DHI's decision support systems, BlueCast. This forecasting system is supported by several global metocean models and data sets to provide reliable assessments of wave, wind and currents at specific user-defined locations. With a multitude of applications oriented towards improving decision-making for and risk assessment of maritime operations, maintenance and safety, the symposium's audience will receive insights into a digital twin of the ocean and its subbasins that is an established out-of-the-box, marketable, commercial product.
