

The EOM working group

Mittwoch, 18. Juni 2025 16:14 (12 Minuten)

The EOM working group is engaged in the development of remote sensing-based evaluation algorithms for the analysis of terrestrial and aquatic ecosystems. We use different sensors to map coastal areas, and in particular shallow water zones, from cm to decameter scale. Examples are water depth, water constituents (e.g., Chl, TSM), benthos mapping (seagrass, macroalgae), floating algae or beach cast. I would like to present current projects and initiate ideas for further co-operation.
